

## Lesson 05 Demo 05

### Creating HTTP Parser

**Objective:** To create an HTTP parser in a Node.js app for handling both HTTP requests and responses

**Tools required:** Node Package Manager and Visual Studio Code

**Prerequisites:** Basic Linux Commands, NPM commands, JavaScript, and HTTP module

Steps to be followed:

1. Create an HTTP parser for an HTTP request

#### Step 1: Create an HTTP parser for an HTTP request

1.1 Import the HTTP and URL modules:

```
JS index.js
JS index.js > ...
1  const http = require('http');
2  const url = require('url');
3
```

1.2 Create the server port and hostname:

```
const SERVER_PORT = 3000;
const SERVER_HOSTNAME = "127.0.0.1";
```

```
JS index.js
JS index.js > ...
1  const http = require('http');
2  const url = require('url');
3
4  const SERVER_PORT = 3000;
5  const SERVER_HOSTNAME = "127.0.0.1";
6
```

1.3 Use the **createServer** function to create the HTTP server:

```
const server = http.createServer();
```

```
JS index.js •
JS index.js > ...
1  const http = require('http');
2  const url = require('url');
3
4  const SERVER_PORT = 3000;
5  const SERVER_HOSTNAME = "127.0.0.1";
6
7  const server = http.createServer();
```

1.4 Create the listener on the server to handle each request, parse through the query string, and convert it into a key-value JavaScript object:

```
server.on("request", (req, res)=> {
```

```
    const query = url.parse(req.url).query
    const queryObj = query.split("&").reduce((prev, next) => {
        let [key, value] = next.split("=");
        return { ...prev, [key]: value }
    }, {});
}
);
```

```
JS index.js > ...
1  const http = require('http');
2  const url = require('url');
3
4  const SERVER_PORT = 3000;
5  const SERVER_HOSTNAME = "127.0.0.1";
6
7  const server = http.createServer();
8
9  server.on("request", (req, res)=> {
10
11
12      const query = url.parse(req.url).query
13      const queryObj = query.split("&").reduce((prev, next) => {
14          let [key, value] = next.split("=");
15          return { ...prev, [key]: value }
16      }, {});
17  }
18  );
```

1.5 Set the **statusCode** as 200 and send the JSON response:

```
res.statusCode = 200;  
res.setHeader("Content-Type", "application/json")  
return res.end(JSON.stringify(queryObj));
```

```
JS index.js > server.on("request") callback  
1  const http = require('http');  
2  const url = require('url');  
3  
4  const SERVER_PORT = 3000;  
5  const SERVER_HOSTNAME = "127.0.0.1";  
6  
7  const server = http.createServer();  
8  
9  server.on("request", (req, res)=> {  
10  
11  
12    const query = url.parse(req.url).query  
13    const queryObj = query.split("&").reduce((prev, next) => {  
14      let [key, value] = next.split("=");  
15      return { ...prev, [key]: value }  
16    }, {});  
17  
18    res.statusCode = 200;  
19    res.setHeader("Content-Type", "application/json")  
20    return res.end(JSON.stringify(queryObj));  
21  });
```

1.6 Specify the port number and hostname to run the server:

```
server.listen(SERVER_PORT, SERVER_HOSTNAME, () => {
  console.log(`Server is up and listening on port ${SERVER_PORT}`);
})
```

```
JS index.js > ...
1  const http = require('http');
2  const url = require('url');
3
4  const SERVER_PORT = 3000;
5  const SERVER_HOSTNAME = "127.0.0.1";
6
7  const server = http.createServer();
8
9  server.on("request", (req, res) => {
10
11
12    const query = url.parse(req.url).query
13    const queryObj = query.split("&").reduce((prev, next) => {
14      let [key, value] = next.split("=");
15      return { ...prev, [key]: value }
16    }, {});
17
18    res.statusCode = 200;
19    res.setHeader("Content-Type", "application/json")
20    return res.end(JSON.stringify(queryObj));
21  });
22
23  server.listen(SERVER_PORT, SERVER_HOSTNAME, () => {
24    console.log(`Server is up and listening on port ${SERVER_PORT}`);
25  })
26
```

1.7 Open the terminal and execute the command:

**node index.js**

```
demopythonlyopm@ip-172-31-16-204:~/Desktop/nodeProjec/demo4$ node index.js
```

1.8 Navigate to the Chrome browser and open the following URL to view the output:

**127.0.0.1:3000/name=Fionna&email=fionna@example.com&age=26**

```
{"name":"Fionna","email":"fionna@example.com","age":"26"}
```

By following these steps, you have successfully created an HTTP parser in a Node.js app for handling both HTTP requests and responses.
